

Thank you for purchasing our reversible temperature indicator. With so much discussion concerning the little birds running hot, and the uncertainty in gauges and temperature sending units, CASCO felt it was to your advantage to accurately measure cooling system temperature. We feel that this indicator will help you determine whether the car is truly running hot or if there is only a problem with gauge/sender components. Questions? - Please call our tech-help line at 740/622-9700. 

Applying Indicator

1. Clean top of radiator just above the inlet pipe with a general purpose degreaser.
2. Peel backing from indicator.
3. Apply with light presser to cleaned surface. Do not apply to surface of rubber hose.

Reading Temperature

- A color change indicates that the temperature shown has been reached.
- After the engine cools, the indicator will return to the original black color.

What to expect

- Our experience has shown that a T-Bird with a good cooling system under normal stop-and-go traffic conditions may reach 203 F without concern.
- If a temperature of 221 F is indicated this may be cause for concern.
